Question 2

Score: **1/1**

Task 2: Activity 1: Copy and paste the code of the emotion_detection.py, saved in a file named 2a_emotion_detection, to show the application function you created for the emotion detection application using the Watson NLP library.

```
import requests

def emotion_detector(text_to_analyse):
    url = 'https://sn-watson-emotion.labs.skills.network/v1/watson.runtime.nlp.v1/NlpService/EmotionPredict'
    headers = {"grpc-metadata-mm-model-id": "emotion_aggregated-workflow_lang_en_stock"}
    myobj = {"raw_document": {"text": text_to_analyse}}
    response = requests.post(url, json=myobj, headers=headers)
    return response.text
```

What to work on next

- **1: The submission includes a dictionary-like result, but it does not show the terminal commands launching the Python shell, importing `emotion_detector`, or testing from `/home/project/final_project`.**
- **2: Revise this part of the submission to address the missing detail described above.**

Question 4

Score: **1/1**

Task 3: Activity 1: Copy and paste the code of the emotion_detection.py file saved in a file named 3a_output_formatting that has modified emotion_detector function to return the correct output format.

```
import json

import requests

def emotion_detector(text_to_analyze):
    url = 'https://sn-watson-emotion.labs.skills.network/v1/watson.runtime.nlp.v1/NlpService/EmotionPredict'
    headers = {"grpc-metadata-mm-model-id": "emotion_aggregated-workflow_lang_en_stock"}
    myobj = {"raw_document": {"text": text_to_analyze}}
    response = requests.post(url, json=myobj, headers=headers)

    formatted_response = json.loads(response.text)
    emotions = formatted_response['emotionPredictions'][0]['emotion']

    result = {
        'anger': emotions['anger'],
        'disgust': emotions['disgust'],
        'fear': emotions['fear'],
        'joy': emotions['joy'],
        'sadness': emotions['sadness'],
    }
    result['dominant_emotion'] = max(result, key=result.get)
    return result
```
